GRACkLe

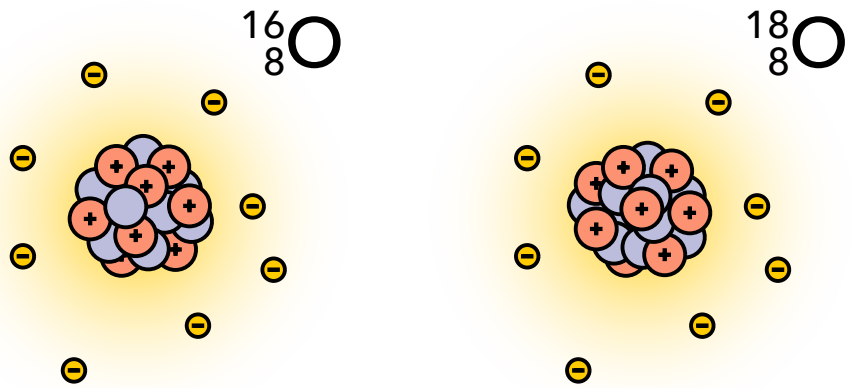

Geochemistry & **R**adioisotope
Analysis & **C**omputation
Laboratory

We study lakes, ice sheets, environmental change, and the dawn of our solar system.

Chemistry & chronology

A cliché in Earth science compares our planet's layers of rocks and sediments to the pages of a book that records Earth's history. If these layers are the pages, then chemistry is the ink upon them.

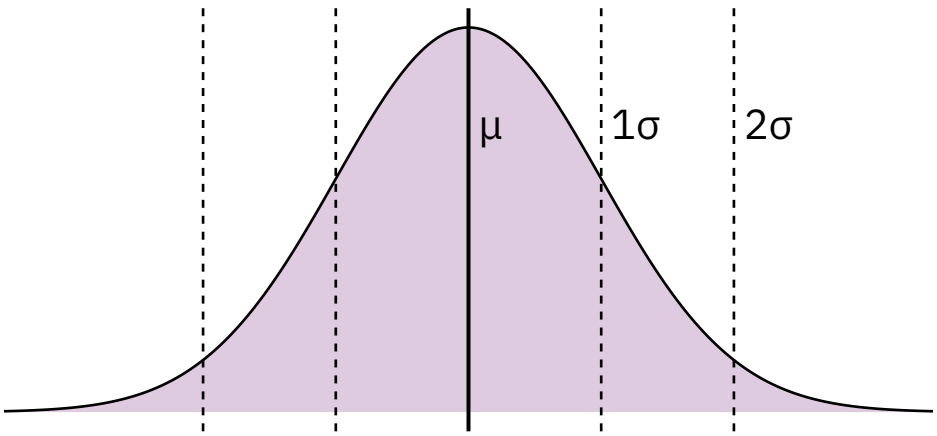

We measure the elemental and isotopic compositions of rocks and minerals to calculate time and reconstruct process in Earth and planetary systems.

Computation & statistics

When reconstructing natural histories from geo- and cosmochemical data, we often rely on mathematical models to relate this data to natural processes.

We borrow techniques from statistics and computer science to compare models and data and find our best possible guesses of what *actually* happened in nature.

The normal distribution of statistics.

Past environmental change

We study the deposits of ancient lakes to reconstruct how climate has changed in the past and how environments respond to a changing climate. We also reconstruct the lifecycles of glaciers, with special emphasis on ice sheet collapse.

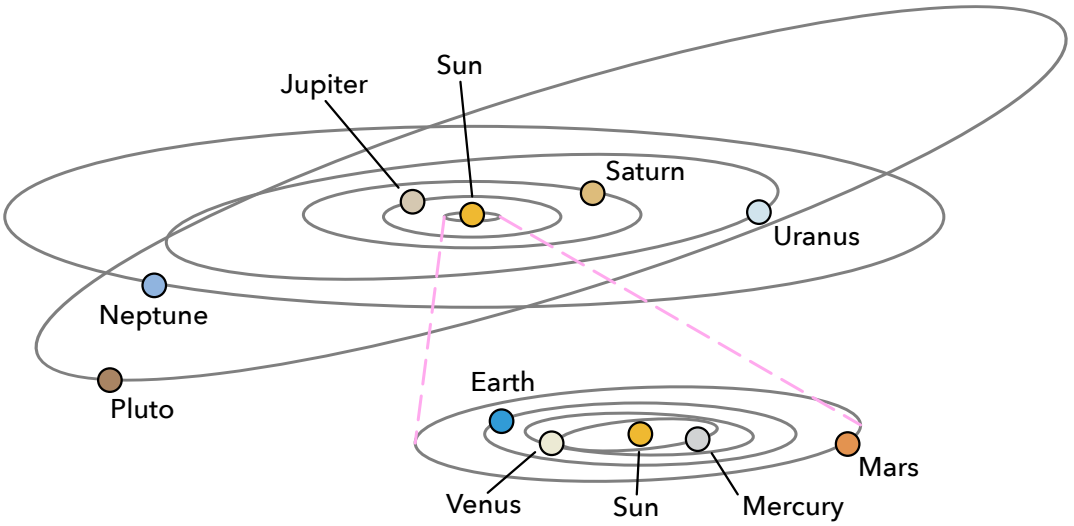

Grulla NWR, New Mexico

Mill Brook, Vermont

Cosmochemistry

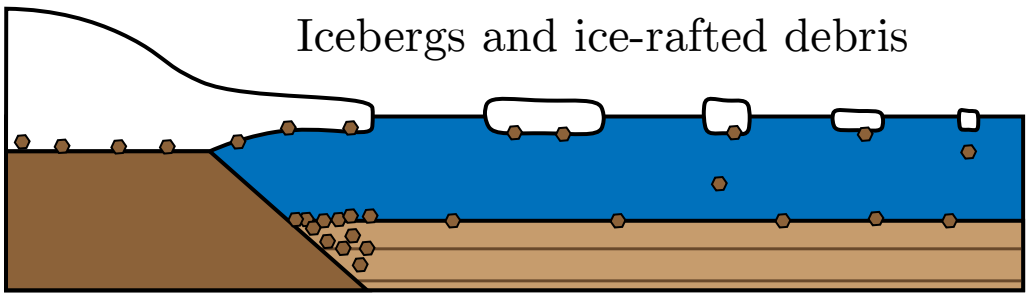

Our solar system[1] first began to form approximately 4.458 billion years ago from a diffuse cloud of gas and dust. We study the chemistry, chronology, and structure of meteorites to reconstruct the formation of our solar system and the first building blocks of the planets.

[1]The solar system includes the Sun and everything that orbits it.

Outreach & museums

We value scientific communication as much as scientific knowledge.

GRACkLe scientists involve themselves in public outreach and education. We have special expertise in exhibit design, collection-based education, and museum outreach.

The many names for rocks from space.

Graham H. Edwards

I am the *primary investigator* of GRACkLe, which means that the research and outreach topics in this zine are also my own interests! I am fascinated by the timescales, tempo, and evolution of Earth's frozen and flooded environments and our celestial neighborhood.

I am an avid bike commuter and a middling sourdough baker. I adore grackles and vultures.

Want to learn more?

If you would like to learn more about the research topics and techniques of GRACkLe, first check out the lab website:
